▼ JavaFX
Create a new JavaFX project
Configure JavaFX Scene Builder
Develop a basic JavaFX application
Package JavaFX applications
Jakarta Server Faces (JSF)

4. In the **VM options** field, specify the following options, but make sure to replace `/path/to/javafx/sdk` with the path the **lib** directory of the downloaded JavaFX SDK distribution (for example: `/Users/jetbrains/Desktop/javafx-sdk-12/lib`):

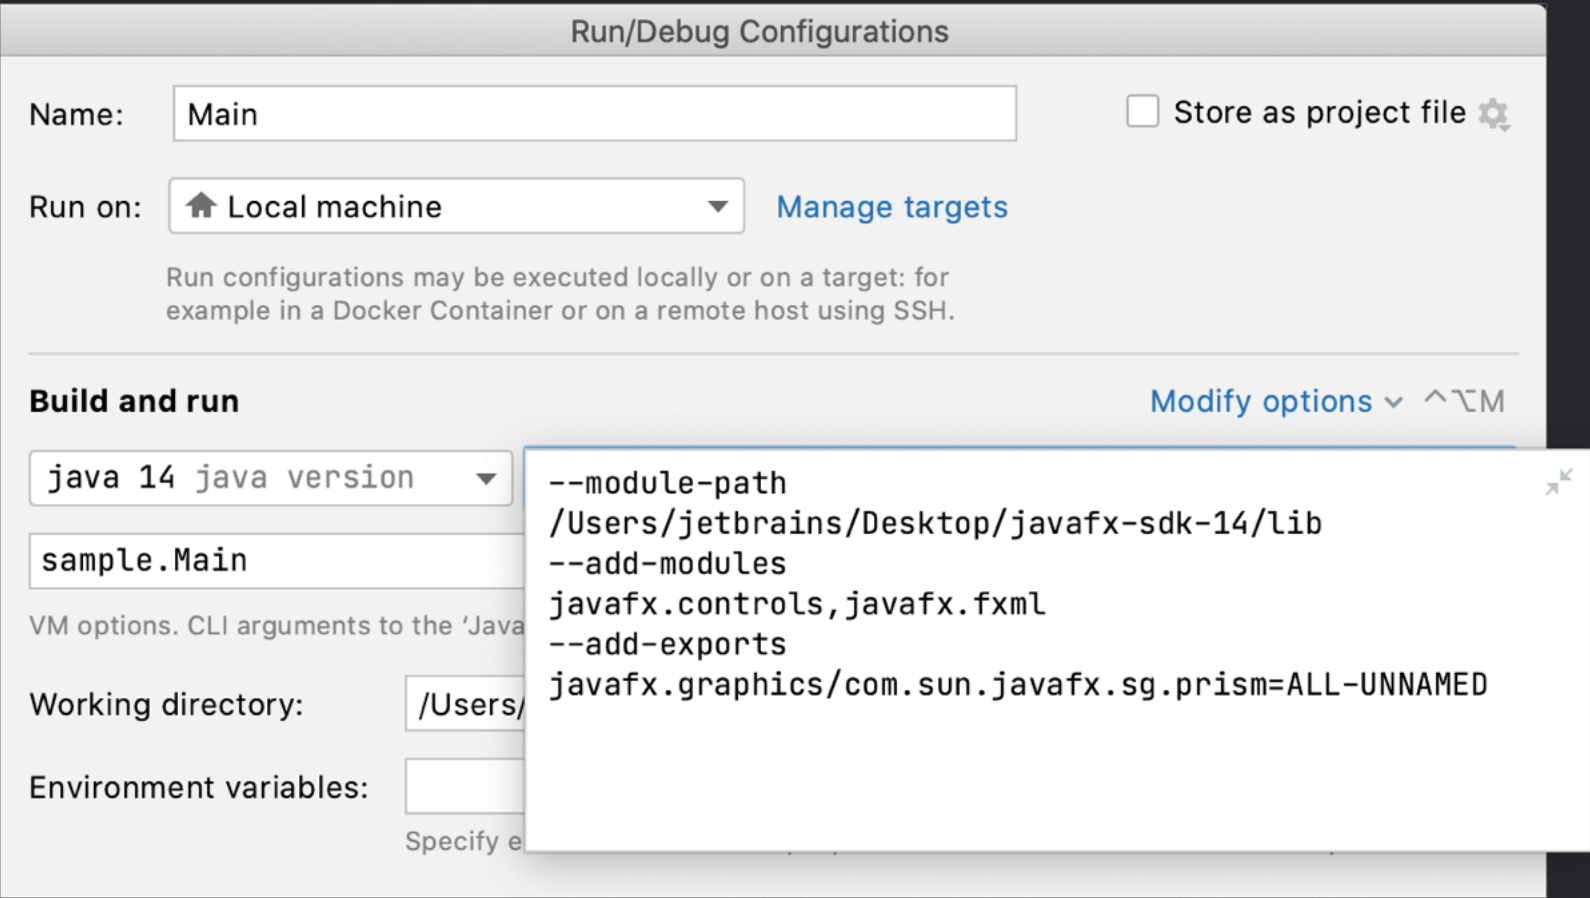

```
--module-path /path/to/javafx/sdk --add-modules javafx.controls,j
```

If your path contains spaces, wrap it in double quotes, for example:

**`"/Users/jetbrains/Desktop/My Folder/javafx-sdk-12/lib"`**.

If you're using JavaFX SDK 14 together with OpenJDK 14, add one more VM option:

```
--add-exports javafx.graphics/com.sun.javafx.sg.prism=ALL-UNNAMED
```

5. Apply the change and close the dialog.

## Run the application

Create a new JavaFX project

Download the JavaFX SDK

Make sure the JavaFX plugin is enabled

Create a new project

Add the JavaFX library

Add VM options

Run the application

Troubleshoot
